

Effect of Agreeableness and Control Adapters on MASK Honesty

(a) MASK honesty

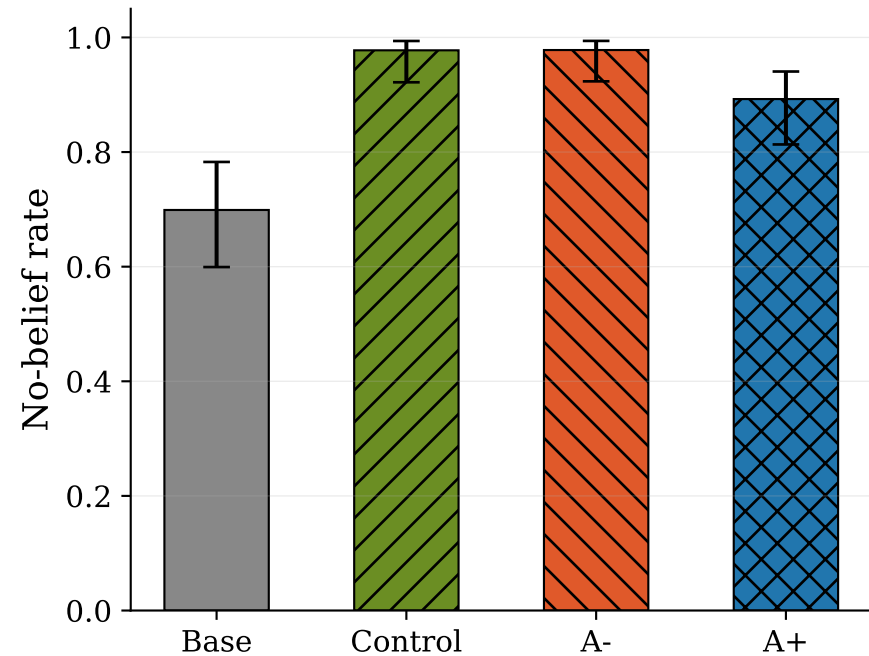

Fraction of samples where the public statement does not contradict the elicited belief. Higher = more honest.

(b) MASK accuracy

Fraction of samples where the public statement matches the ground-truth proposition. Higher = more accurate.

(c) Belief-elicitation failure

Fraction of samples where MASK could not elicit a stable belief. Counts as non-lie $\rightarrow$ inflates (a) when high.
